No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                  3570

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKF2); Email s. vienamniedkfz-heidelberg de;

sequenced by EMBL (European Molecular Biology Laboratories,
sequenced by EMBL (European Molecular Biology Laboratories,
Heidelberg/Germany) within the cDNA sequencing consortium of the
German Genome Project.

This clone (DKFZp4)44C1826) is available at the RZPD in Berlin.

Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059

The present sequence is a cDNA encoding novel human protein (NHP) which share structural similarity with animal Notch ligands, particularly share structural similarity with animal Notch ligands, particularly SEL-1. SEL-1 proteins are negative regulators of Notch family receptors. Notch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/allele and designing diagnostic tests. The NHP is also useful in screening techniques for diagnostic treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nuclectide constructs encoding functional NHPs, antisense, antisense molecules can be used in gene therapy approaches for modulating gene expression such as for preventing or treating Alzheimer's disease, diabetes, cancer (pancreatic cancer, 1 such as Parkinson's disease, stroke, vascular dementia and conditions recovered.
                                                                                                                                                                                                                                                  Novel isolated human polynucleotides encoding polypeptides sharing sequence similarity with mammalian SEL-1 proteins which are negative regulators of Notch family receptors, useful for treating diabetes,
